ABSTRACT OF THE DISCLOSURE

**APPLYING TRANSLUCENT FILTERS ACCORDING TO VISUAL DISABILITY NEEDS
IN A NETWORK ENVIRONMENT**

5

A method, system and program for selectively applying
translucent filters to graphical images according to visual
disability needs are provided. An image is received at a
receiver communicatively connected via a network to an image
server and connected to a display device for output of the image.
A translucent style is specified for a particular user at the
receiver. A translucent filter overlay is applied over the image
according to the translucent style for output to the display
device, such that the image output to the display device is
adjusted to specifically accommodate for a visual disability of
the particular user.
